

AI Builder Prompt System

By Cassandra Peterson

A practical prompt workbook for founders, builders, and solo operators who want to turn fuzzy ideas into clearer products, sharper pages, better content, and implementation-ready plans. This is not a list of cute one-line prompts. It is a system for thinking, deciding, reviewing, and shipping with AI as a working partner.

What this helps you create

Use this system to produce five real artifacts: a product brief, an offer page outline, a launch plan, a workflow map, and a developer-ready implementation brief.

The working loop

Each prompt is designed to move from messy context to a reusable product asset.

What Is Inside

Artifact Map

The product is organized around useful documents buyers can produce, edit, and reuse.

Who This Is For

- Early founders shaping a first product or paid digital offer
- Developers who want better product thinking before they code
- Freelancers and solo operators turning repeatable work into systems
- AI-curious builders who want structure, not random prompt tricks

What You Should Walk Away With

- Clarify what you are selling and why someone should care
- Audit whether a product feels worth the price
- Turn messy ideas into page copy, launch content, SOPs, and dev briefs
- Catch checkout, UX, and delivery gaps before customers do
- Create reusable operating docs instead of one-off AI chats

30-Minute Quick Start

1. Pick one active project, product, or workflow.
2. Fill in the Context Block once and reuse it for every prompt.
3. Run the Product Clarity Sprint, Paid Product Value Audit, and Product Page Conversion Review.
4. Save the outputs in one doc and convert them into the templates at the end.
5. Use the scorecards to decide what to improve before launch.

Start Here: The Working Method

1. The Context Block

Use this before any prompt in the pack.

Copy this structure and fill it in: I am working on [product/business/project]. The audience is [audience]. The problem is [problem]. The current state is [what exists now]. My constraint is [time, budget, skill, platform, confidence, messy data, etc.]. I need help producing [specific output]. A good answer should be [format, tone, depth, examples, risks, tradeoffs].

Why it matters: Most weak AI answers come from weak context. This block gives the model enough material to act like a useful collaborator instead of a fortune cookie.

2. The Better Answer Loop

Use when the first answer is generic.

Prompt: The answer is too broad. Challenge your own assumptions, ask me five clarifying questions, and then give me a more specific version. Prioritize practical decisions over motivational language. If there are tradeoffs, name them plainly.

Output to save: The improved answer, the open questions, and the decision you made after reviewing it.

3. Turn This Into a Real Asset

Use after AI gives you a useful answer.

Prompt: Convert this response into a usable asset. Give me a polished version as a [checklist, page section, product brief, email, issue ticket, launch plan, workflow map, content calendar, or SOP]. Remove filler. Keep the language specific to my audience and goal.

Output to save: One clean artifact you can reuse, publish, or hand to a developer.

4. Decision Memo

Use when you are stuck between options.

Prompt: I am deciding between [option A], [option B], and [option C]. Compare them by customer value, build effort, risk, speed to launch, future flexibility, and confidence level. Recommend one option and explain what would make you change your recommendation.

Output to save: A one-page decision memo with chosen path, reasons, risks, and next action.

Worked Example: Digital Product Readiness

1. Example Context

Scenario: A builder is selling a \$29 AI prompt workbook for early founders.

Context Block: I am working on a paid digital product called AI Builder Prompt System. The audience is early founders, solo builders, and developers who want to use AI for product planning and launch work. The problem is that generic prompts do not produce usable assets. The current state is a PDF with product, UX, content, workflow, and developer prompts. My constraint is that it must feel worth \$29 without becoming a giant course. I need help producing a value audit and improvement plan. A good answer should be specific, direct, and focused on what a buyer can actually use.

2. Example Prompt

Review this paid product idea. Is it worth \$29? Evaluate by outcome, specificity, usefulness, ease of implementation, buyer urgency, perceived polish, and what a customer might feel after opening it. Tell me what is missing and what would make it feel worth 2x the price.

3. Example Useful Output

Strong enough for beginners, not yet strong enough for advanced buyers. To justify the price, add: worked examples, scorecards, fill-in templates, launch checklists, and clear artifacts buyers can produce. The product should promise outcomes, not prompts. Recommended upgrade: reposition from prompt pack to operating workbook and include a five-artifact workflow.

4. What To Do With the Output

Do not stop at reading the answer. Convert it into product changes: rename the offer, add a quick-start workflow, add scorecards, include examples, and update the product page to explain the artifacts a buyer will walk away with.

Product Clarity and Offer Design

1. Product Clarity Sprint

Use when the idea still feels fuzzy.

Prompt: Act as a senior product strategist. I am building [product]. The audience is [audience]. The current idea is [idea]. Help me clarify the core problem, the painful before-state, the desired after-state, the main promise, the first user journey, and the smallest paid version I can launch. Give me a prioritized plan with tradeoffs.

Output to save: Product promise, target buyer, first version scope, and a launch checklist.

2. Paid Product Value Audit

Use before selling a digital product.

Prompt: Review this paid product idea: [describe product]. Is it worth the price of [price]? Evaluate by outcome, specificity, usefulness, ease of implementation, buyer urgency, perceived polish, and what a customer might feel after opening it. Tell me what is missing and what would make it feel worth 2x the price.

Output to save: Improvement list ranked by customer value.

3. Offer Positioning Matrix

Use when you need better product copy.

Prompt: Help me position [product] for [audience]. Generate five offer angles. For each, include the buyer problem, emotional driver, practical outcome, proof angle, what is included, and a concise sales-page headline.

Output to save: One primary angle and two backup angles.

4. Customer Objection Map

Use before publishing the product page.

Prompt: List the likely objections someone would have before buying [product]. Include objections about price, trust, usefulness, time, skill level, and whether they can get this for free elsewhere. For each objection, write a response, a product improvement, and a page section that could address it.

Output to save: FAQ section and product-page improvements.

5. MVP Scope Filter

Use when the product is becoming too big.

Prompt: Review this feature/content list: [features]. Separate it into launch-critical, strong bonus, useful later, and distracting. Explain why each item belongs there and suggest the leanest version that still feels valuable and complete.

Output to save: Final launch scope.

6. Premium Upgrade Ideas

Use when you want a higher-value version.

Prompt: I have a starter product: [product]. Suggest ten ways to make it feel more premium without overbuilding. Include templates, examples, walkthroughs, checklists, worksheets, bonus files, support options, and implementation aids. Rank by perceived value and effort.

Output to save: Upgrade roadmap for version two.

Scorecards and Rubrics

1. Paid Product Value Scorecard

Score your product from 1 to 5 in each category.

Outcome clarity: Does the buyer know what they will be able to do after using it?

Specificity: Is it tailored to a real buyer or generic enough to ignore?

Usability: Can the buyer apply it within 30 minutes?

Completeness: Does it include examples, templates, and next steps?

Trust: Does the product explain delivery, support, and limitations?

Polish: Does it feel intentionally packaged?

Interpretation: 24-30 is ready to sell. 18-23 needs one focused improvement pass. Under 18 should not launch yet.

2. Prompt Quality Rubric

A strong prompt should include: role, context, audience, goal, constraints, output format, quality bar, and what to avoid. If a prompt only says 'act as X and give me Y,' it is probably too generic. Upgrade it by adding the situation, desired artifact, and decision the output should support.

3. Launch Readiness Gate

Before launch, answer yes/no: Is the product delivered automatically? Does the success page set expectations? Does the email include support instructions? Does the product include examples? Does the page explain who should not buy it? Have you tested mobile checkout? Have you reviewed the first customer experience from click to delivery?

Page, UX, and Checkout Review

1. Product Page Conversion Review

Use before turning on the Buy button.

Prompt: Review this product page: [paste copy or describe layout]. Evaluate clarity, trust, visual hierarchy, offer strength, buyer reassurance, price justification, missing proof, mobile scanning, and conversion friction. Give me a prioritized punch list with exact copy improvements.

Output to save: Product-page revision checklist.

2. Checkout Confidence Audit

Use when payment works technically but may not feel trustworthy.

Prompt: Analyze this checkout flow: [describe flow]. Identify moments where the buyer may hesitate, get confused, or worry. Suggest improvements for button copy, confirmation copy, refund/support language, delivery expectations, and post-purchase reassurance.

Output to save: Checkout trust checklist.

3. Success Page Rewrite

Use after payment confirmation.

Prompt: Rewrite this success page for a digital product purchase: [current copy]. The customer should feel reassured that payment worked, know when and how the product will arrive, know what to do if they need help, and feel good about the purchase.

Output to save: Final success page copy.

4. Mobile Scan Test

Use for any product or landing page.

Prompt: Evaluate this page for mobile scanning: [paste page structure]. Tell me what a buyer understands in the first 5 seconds, what they may miss, what feels too vague, and what should become a clearer action. Give me a before/after hierarchy.

Output to save: Mobile-first layout priorities.

5. Trust Gap Finder

Use when a product feels good to you but may not be convincing to buyers.

Prompt: Find the trust gaps in this offer: [offer/page]. What claims need proof? What terms need examples? What buyer fears are unaddressed? What would make this feel safer to buy from a solo creator?

Output to save: Trust-building improvements.

Copy/Paste Templates

1. Product Brief Template

Product name:

Buyer:

Problem:

Why now:

Promise:

Included assets:

Not included:

How to use it:

Time to first useful result:

Price:

Why it is worth the price:

Proof or credibility:

Delivery method:

Support path:

Upgrade ideas:

2. Offer Page Outline

Hero: product name, buyer, promise, price, CTA.

Problem: what the buyer is struggling with.

Outcome: what they can create or decide after using it.

Inside: list the sections/assets.

How it works: 3-5 step usage flow.

Who it is for: specific buyers.

Who it is not for: honest boundaries.

FAQ: delivery, refunds/support, skill level, time required.

CTA: repeat price and action.

3. Developer Handoff Template

Feature:

User story:

Goal:

Non-goals:

User flow:

UI states:

Data needed:

API/events needed:

Edge cases:

Failure states:

Acceptance criteria:

Analytics/logging:

Test checklist:

Launch/rollback notes:

4. Workflow Automation Brief

Workflow name:

Trigger:

Inputs:

Steps:

Decision points:

Tools involved:

Failure points:

Manual fallback:

Notification needs:

Data to log:

Owner:

First version:

Future upgrade:

Content and Launch Messaging

1. Content Pillar Builder

Use when you need consistent marketing content.

Prompt: I want to create content around [topic/product]. Build five content pillars for [audience]. For each pillar, include the buyer belief it supports, example post ideas, proof points, and a soft product tie-in.

Output to save: Content pillar map.

2. Launch Week Calendar

Use when a product is almost ready.

Prompt: Create a 7-day launch content plan for [product]. Include the theme of each day, one short post idea, one longer post idea, one email idea, the buyer question being answered, and the CTA. Keep it practical and non-cringey.

Output to save: Launch calendar.

3. Build-In-Public Update

Use when sharing progress without sounding fake.

Prompt: Turn this progress update into a build-in-public post: [notes]. Make it honest, useful, and specific. Include a short version, a longer version, and a closing line that invites conversation without sounding salesy.

Output to save: Publish-ready post.

4. Email Launch Sequence

Use when you need more than one announcement.

Prompt: Write a three-email launch sequence for [product]. Email 1 should introduce the problem and product. Email 2 should show what is inside and who it is for. Email 3 should handle objections and invite action. Keep the tone helpful and direct.

Output to save: Three emails ready for editing.

5. Case Study Extractor

Use to turn project work into marketing proof.

Prompt: Using this project description: [project], create a concise case study with problem, constraints, process, decisions, outcome, and reusable lessons. Make it useful for a portfolio, product page, or founder note.

Output to save: Case study draft.

Workflow and Automation Planning

1. Manual Process Mapper

Use when a business process feels messy.

Prompt: I currently do this process manually: [process]. Break it into steps, identify repeatable decisions, data needed, failure points, handoff risks, and automation opportunities. Recommend a phased automation plan that starts simple.

Output to save: Workflow map and automation roadmap.

2. Tool Stack Simplifier

Use when tools are multiplying.

Prompt: Review this workflow and tool stack: [workflow/tools]. Identify duplicate tools, fragile handoffs, missing ownership, security concerns, and simple automations that would reduce admin time.

Output to save: Keep/remove/automate list.

3. Client Intake System

Use for service businesses or freelance workflows.

Prompt: Design a client intake flow for [service/business]. Include form fields, qualification logic, follow-up email, internal notes, next actions after submission, and what should happen if the lead is not a fit.

Output to save: Intake SOP.

4. Fulfillment SOP

Use after someone purchases a digital product or service.

Prompt: Create a fulfillment SOP for [product/service]. Include payment confirmation, customer email, file delivery, failure states, support response, refund/escalation process, and post-purchase follow-up.

Output to save: Fulfillment checklist.

5. Automation Risk Review

Use before automating customer-facing flows.

Prompt: Review this automation plan: [plan]. Identify what can fail, what the user would experience, what should be logged, what should be retried, and when a human should be alerted.

Output to save: Risk and monitoring checklist.

Implementation and Developer Handoff

1. Feature Build Brief

Use when moving from idea to code.

Prompt: Turn this product idea into an implementation brief for a developer: [idea]. Include user story, expected behavior, edge cases, data needs, UI states, acceptance criteria, and test checklist.

Output to save: Developer-ready feature brief.

2. Bug Report Upgrade

Use when a bug report is too vague.

Prompt: Rewrite this rough bug report into a developer-ready issue: [bug notes]. Include reproduction steps, expected behavior, actual behavior, likely area, screenshots needed, severity, and acceptance criteria.

Output to save: Clear issue ticket.

3. Test Plan Generator

Use before shipping.

Prompt: Create a practical test plan for [feature/product]. Include happy path, failed payment or error states, mobile checks, browser checks, accessibility checks, email checks, analytics checks, and rollback concerns.

Output to save: QA checklist.

4. Release Readiness Check

Use when you are tempted to ship fast.

Prompt: Review this upcoming release: [release notes]. Create a launch checklist covering UX, copy, analytics, payment flow, email delivery, error states, mobile, accessibility, privacy, and rollback concerns. Flag anything that should block launch.

Output to save: Go/no-go checklist.

5. Code Review Assistant

Use when reviewing a pull request or code change.

Prompt: Review this change: [summary/code]. Focus on bugs, data loss, security, edge cases, user-facing regressions, missing tests, and unclear assumptions. Give findings first, then suggested fixes.

Output to save: Review notes.

Bonus Worksheets

1. One-Page Product Brief

Fill this in before building or selling.

Product name:

Audience:

Painful before-state:

Desired after-state:

Core promise:

What is included:

What is not included:

Price:

Why it is worth that price:

Delivery method:

Support promise:

First version launch date:

Known risks:

Next improvement:

2. Product Page Checklist

Before publishing, confirm the page includes: who it is for, what problem it solves, what is inside, what outcome the buyer gets, how delivery works, price, support path, proof or credibility, FAQs, refund/support expectations, mobile readability, and a clear action button.

3. Post-Purchase Experience Checklist

After checkout, confirm the customer receives: clear success page, confirmation email, product attachment or access link, support contact, order reference, what to do next, and reassurance that they can reply if something breaks.

4. Version Two Upgrade Plan

After launch, collect: buyer questions, refund reasons, support replies, which sections people use, what felt unclear, what examples were missing, and what could become a template or bonus. Use that to improve the product before raising the price.

A Simple Workflow

1. Choose one prompt that matches the decision in front of you.
2. Add specific context from your product, audience, and current constraints.
3. Ask for a concrete artifact: checklist, page outline, implementation brief, launch plan, or review.
4. Edit the answer with your judgment.
5. Save the useful output in your product notes so it can become part of your system.

Thank you for buying this pack. You can reply to your delivery email if you have trouble accessing the file.
